

Executive Summary – Data Analytics Capstone Project

This project performs an end-to-end data analytics workflow on multiple real-world datasets including Sales Data, Customer Churn Data, and House Prices Data. The objective is to identify key drivers, validate assumptions using statistical methods, and provide actionable business insights.

Key Findings

- Strong correlations observed between major numerical variables
- Statistically significant differences identified through hypothesis testing
- Regression models demonstrate predictive relationships across datasets

Business Recommendations

- Focus on high-impact variables identified through regression analysis
- Use data-driven segmentation strategies for decision-making
- Continuously monitor KPIs discovered during EDA

Business Impact

The insights from this analysis enable better strategic planning, optimized resource allocation, and improved business performance through data-backed decisions.
